

STOUTSTUFF™

RAIL MOUNTING

INSTRUCTIONS

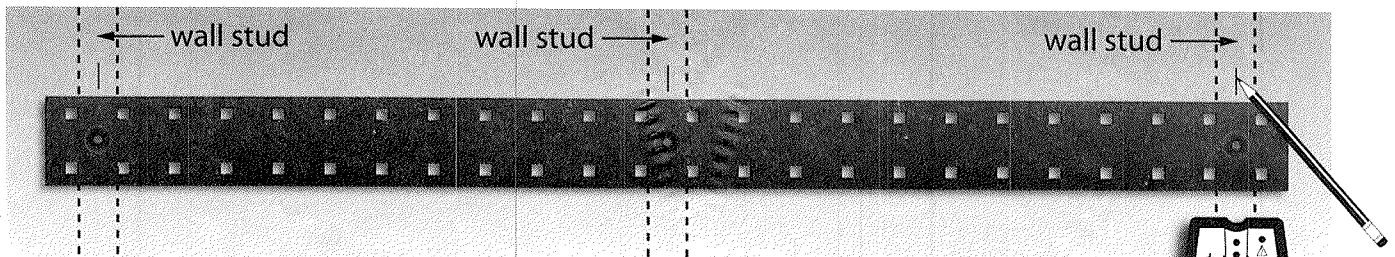

WARNING: Rail must be mounted to at least 2 wall studs. If only anchors are used, the system will NOT hold substantial weight and may pull away from the wall, potentially causing property damage and/or injury.

REQUIRED TOOLS: Level, Stud Finder, Power Drill, Phillips Head Screw Driver or Bit, Pencil, 1/8" Drill Bit

INSTALLATION:

1. Locate wall studs with a stud finder and mark the locations with a pencil. Each rail, at minimum, must hit two wall studs at each end of the rail, to be properly installed.

2. Place the rail at desired height aligning it with the studs. Drill a pilot hole at one end of the rail. Insert screw and tighten snug, but do not fully tighten. Level the rail and mark and drill the second pilot hole at the opposite end of the rail. Insert the second screw and completely tighten. Go back to the first screw and completely tighten. Drill and insert the middle screw and completely tighten.
